

CLAIM AMENDMENTS

1.-21. (Cancelled)

22. (Currently Amended) A method comprising:

mounting a tray, the tray including an open groove defined by first and second longitudinal edges that are substantially parallel to each other, the first longitudinal edge being located a first distance from the groove and the second longitudinal edge being located a second distance greater than the first distance from the groove;

placing a cable in the groove;

selectively routing the cable through a notch in the first edge and a notch in the second edge; and

placing a cover in proximity to the first and second longitudinal edges to close the groove and conceal the cable in the groove.

23. (Previously Presented) The method of claim 22, wherein the first and second longitudinal edges are substantially orthogonal with respect to each other.

24. (Previously Presented) The method of claim 22, wherein placing comprises contacting at least one of the first and second longitudinal edges with the cover.

25. (Previously Presented) The method of claim 22, wherein the notch in the first edge comprises one out of a plurality of notches in the first longitudinal edge.

26. (Previously Presented) The method of claim 25, wherein the notch in the second edge comprises one out of a plurality of notches in the second longitudinal edge.

27. (Previously Presented) The method of claim 25, wherein said plurality of notches are uniformly spaced with respect to each other along the first longitudinal edge.

28. (Previously Presented) The method of claim 22, wherein the first and second longitudinal edges impart a slope to the cover when the cover closes the groove relative to the groove.

29. (Currently Amended) A method comprising:
forming a tray, the tray including an open groove defined by first and second longitudinal edges that are substantially parallel to each other, the first longitudinal edge being located a first distance from the groove and the second longitudinal edge being located a second distance greater than the first distance from the groove;
adapting the groove to hold at least one cable so that said at least one cable may be selectively routed through a notch in the first edge and a notch in the second edge; and
forming a cover to be placed in proximity to the first and second longitudinal edges to close the groove and conceal said at least one cable in the groove.

30. (Previously Presented) The method of claim 29, wherein the first and second longitudinal edges are substantially orthogonal with respect to each other.

31. (Previously Presented) The method of claim 29, wherein the forming comprises adapting the cover to contact at least one of the first and second longitudinal edges.

32. (Previously Presented) The method of claim 29, wherein the notch in the first edge comprises one out of a plurality of notches in the first longitudinal edge.

33. (Previously Presented) The method of claim 32, wherein the notch in the second edge comprises one out of a plurality of notches in the second longitudinal edge.

34. (Previously Presented) The method of claim 32, wherein said plurality of notches are uniformly spaced with respect to each other along the first longitudinal edge.
